

CLAIMS:

1. A method for making an elongated article comprising the steps of:
feeding at least one base string along an axis;
wrapping at least one monofilament around the axis to produce a
5 number of monofilament wraps per length of base string which are
transported by the base string;
bonding the wraps to the base string; and
cutting the wraps at a point downstream of where the wraps are
bonded to the base string to thereby form an article having two rows of
10 monofilament segments connected to the base string.

2. A method for making an elongated article comprising the steps of:
feeding a base string along a first support;
wrapping at least one monofilament around a second support to
15 form a plurality of loops;
feeding the loops transversely over the at least one base string;
pressing the loops into contact with the base string, whereby the
loops are transported by and with the at least one base string; and
bonding the wraps to the base string to form an article having two
20 rows of monofilament loops connected to the base string.
